SIEMENS

Ingenuity for life

The worldwide standard for home and building control

KNX

Save energy while maintaining a constant room climate

Room thermostats that maximize control accuracy for heating, ventilation and air conditioning (HVAC) applications.

siemens.com/thermostats

Room thermostats for maximum comfort and energy efficiency

Siemens has a complete thermostat portfolio, ranging from simple mechanical and digital room thermostats for basic room climate control to advanced KNX communicating thermostats for integration into building automation systems. The thermostat portfolio is enhanced with a Smart Thermostat for heating applications.

Special emphasis is placed on fast installation, intuitive operation and accurate control. The stand-alone room thermostats cover all room HVAC applications: heating and/or cooling, fan coils and variable air volume.

The KNX communicating thermostats offer powerful yet cost-effective room automation. These communicating thermostats are offered for stand-alone room climate control and for more sophisticated room automation in projects with Siemens' Desigo controllers.

The option to integrate Siemens' thermostats into building management systems – Desigo™ CC, Desigo Control Point or Synco IC – enables remote operation and service.

Smart Thermostat

It's the unique combination of benefits for both professional installers and end customers that makes the Siemens Smart Thermostat so different.

Easy and intuitive

The display has been reduced to the essentials for the easiest possible use; and an intuitive mobile app allows control and monitoring from anywhere, anytime.

Built-in sensors

Six built-in sensors detect temperature, presence or absence, humidity and hazardous gases. Another sensor adjusts the display based on ambient light.

It's also possible to connect external sensors to measure outside temperature, humidity and window contact.

Autonomous control

For the best climate possible, the Smart Thermostat learns and uses the thermal behavior of the room. The patented self-learning algorithm ensures the best temperature control, and Optimum Start Control defines the ideal moment to start heating. These unique functions save energy and maintain comfort with minimal user intervention.

Proven green technology

The Smart Thermostat satisfies high energy-efficiency standards, and the special Green Leaf feature saves even more energy.

Easy commissioning

To minimize effort, the Smart Thermostat can be installed during construction with no Internet connection required. The final commissioning steps are performed by the residents after they move in.

Automatic firmware updates ensure that the latest features are always available.

siemens.com/smart-thermostat

Highlights

- No Internet connection required for installation
- Navigation wizard for fast commissioning
- Easy and highly intuitive user interface
- Satisfies high energy-efficiency standards
- Always up-to-date with free software upgrades

Applications at a glance

Energy-efficient room temperature control

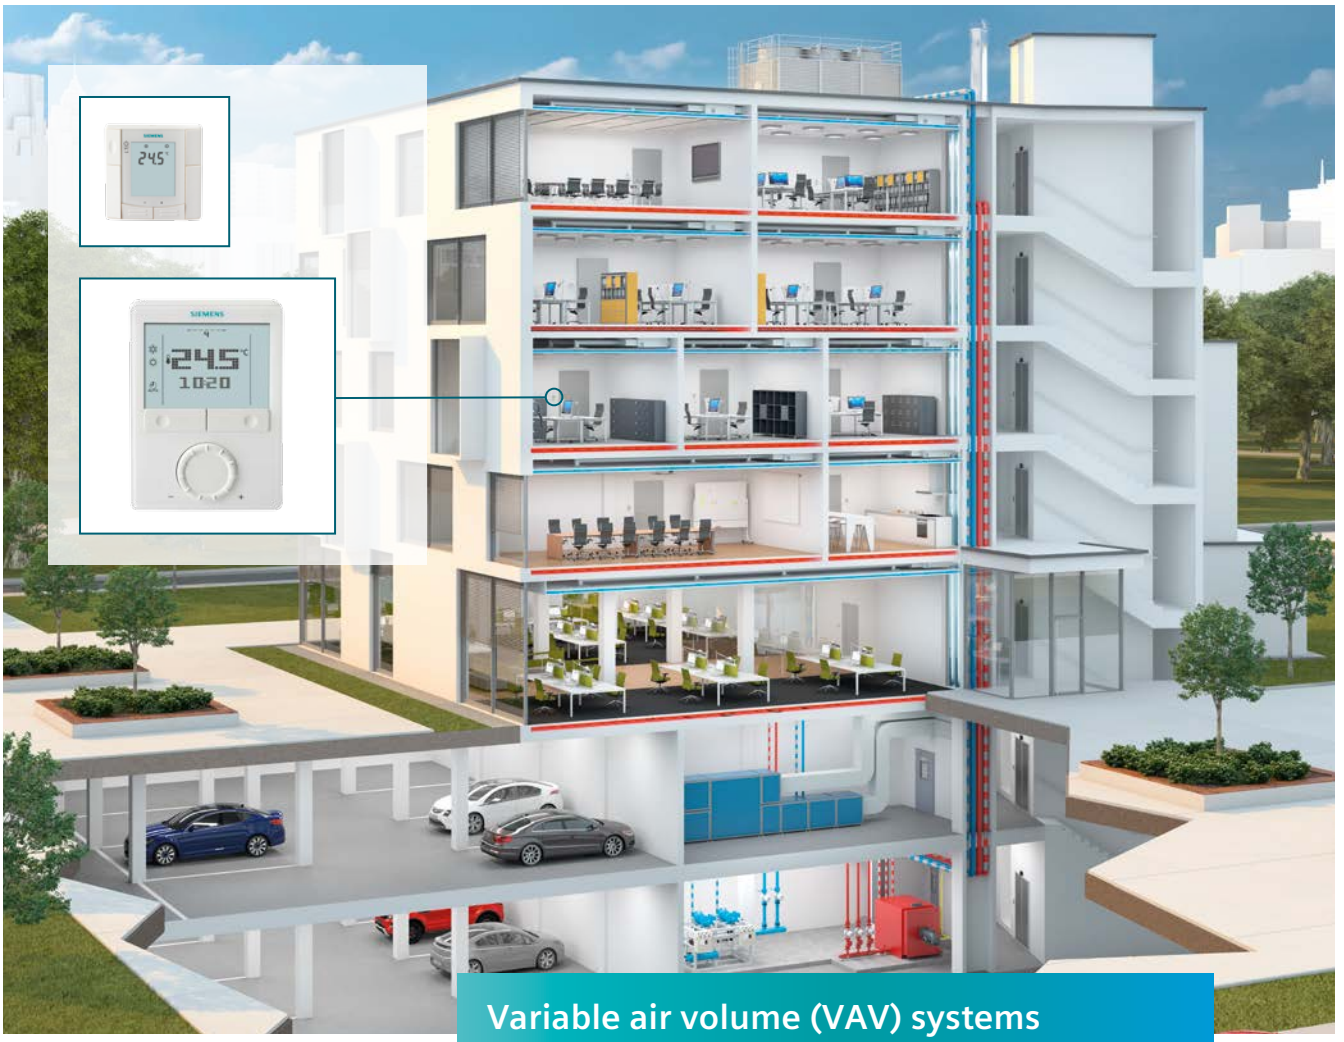
For typical applications with radiators and underfloor heating systems, Siemens offers room thermostats with optimized PID control and self-learning programs. In addition, special variants support applications for domestic hot water and electrical heating systems – with control of up to 16 A. Multifunctional inputs allow activation of functions like dew point monitoring, window contact and remote changeover, if desired. Variants with a KNX communication interface make it possible to control the primary system with even greater energy efficiency. Configurable time programs (day/week/vacation) prevent unnecessary energy consumption when rooms are not in use. The Smart Thermostat RDS110 features a sophisticated bundle of smart features. Quickly and easily installed even with no Internet connection, the thermostat can be intuitively controlled on the go using a remote app. Built-in sensors, a Green Leaf function, and a higher energy-efficiency class also increase your building's value and decrease energy costs.

Fan coil systems

Fan coil systems are especially appropriate for individual room control in hotels and offices. The wall- or flush-mounted room thermostats control 2/4-pipe fan coil applications directly, even with add-on functions like electrical heating or underfloor heating. Thanks to configurable parameters, the room thermostats can also control different types of drives (On/Off, PWM, 3-point and DC) and fans (1/3-step and DC signals). Integrated functions like time programs, presence detectors and supply-air temperature limitation automatically optimize energy demand – without sacrificing room comfort. Thanks to their energy efficiency applications, RDG room thermostats with KNX communication interfaces meet efficiency class AA according to eu.bac.

Heat pump

From manual operation to automatic control, room thermostats for heat pump applications address the heat pump directly; in other words, they can control and release the pump according to the desired room temperature. This prevents overheating from sun exposure or energy from an external source. In applications with reversing valves, the room thermostats control compressors in heating or cooling mode with automatic or manual changeover. The configurable parameter for the minimum on and off times prevents damage to the compressor that would result in a shorter service life.



Variable air volume (VAV) systems

Thanks to their selectable control signals, VAV-compatible room thermostats can be connected directly to a variety of devices, including VAV boxes, dampers and VAV compact controllers. The wide range of models also allows users to change settings using control parameters. As a result, VAV applications can be combined with add-on functions – from electrical heating, radiators and underfloor heating systems to heating/cooling coils. In addition to their basic functions, the room thermostats can also be used to set minimum and maximum limits for the air volume signal. Resetting the damper position on the room thermostat can optimize the primary air control – even in applications with supply and exhaust air. Thanks to KNX communication, the room thermostats can be directly connected to an indoor air-quality sensor and control room comfort even more efficiently.

An overview of the room thermostat portfolio
